INFORMATION BULLETIN

PROTECTION OF ELECTRICAL CONNECTIONS

Due to extreme weather conditions, exposed electrical connections can become corroded and deteriorated to the point of causing system failure in as little as one month of operation.

On all vehicles, especially where exposure to road salts and deicing chemicals is common, all electrical connections should be protected from these conditions. Crimped and soldered connections should be protected with shrink tube. Ring terminal connections such as pump relay connections and frame ground connections should be thoroughly coated to provide protection.

It is recommended that Red Air Dry Enamel (RANVAR), number B6-665, produced by the P.D. George Company is used.

After spraying all connections thoroughly allow the coating to dry, then apply a second coat.

It is important to protect all connections at the time of original installation and also any time repairs are made. It is recommended that connections are checked and maintained as a part of normal maintenance.
